Exploring the Data

What is your outcome variable(s)? How well does it measure the outcome you are interested in? How does it relate to your hypotheses? What are your key explanatory variables? In addition, create a table of summary statistics for the variables you are planning to use.

General Answer: Our outcome variable is civil society participation, which is v2x_cspart in the code.

We will use the predictor variables listed above, which include: civil society repression effort scores, v2csreprss social support scores, happiness freedom to make life choices, happiness presence of war, e_civil_war presence of coups, e_pt_coup participation rate in civil society, v2x_partipdem generosity, happiness education, e_peaveduc and government corruption. v2x_corr

Merging data - James

```
wh_2023 <- read_excel("/cloud/project/data/wh_2023.xls")
# View(wh_2023)
load("/cloud/project/data/vdemdata-master/data/vdem.RData")</pre>
```

Cleaning data - Alicia

- Count how many NA observations we have. If it is under %, we will omit the obs. or we could assign some values to them using given method.
- Drop columns not needed
- Rename the columns based on the code book
- Histograms and box plots
- Create a table of summary statistics for the variables you are planning to use.

these questions need to be answered

What data cleaning did you have to do? How did you wrangle the data? Are you deciding to exclude any observations? If so, why? Did you have to create any new variables from existing variables? If so, how and why?

```
# changing the NA entries with a median of that column
summary(total)
```

```

Data Visualization - Ephrata and Kaori

How well does it measure the outcome you are interested in? - Kaori

We chose civil society participation as our outcome variable. We were originally going to use civil society index, but we were not able to find much information regarding the actual measures considered, so we chose to use civil society participation instead. This is because civil society index may have already considered factors we are adding to the model, while civil society participation will tell us how many people are actually participating in civil society, which is the public sphere between the private sphere and government, which can include professional organizations, charities, labor unions, and spiritual groups.

What is our hypothesis? - Kaori

Our hypothesis is that countries with similar characteristics regarding supporting/ not supporting civil society—such as the presences of war or good educational systems—will have similar civil society participation rates.

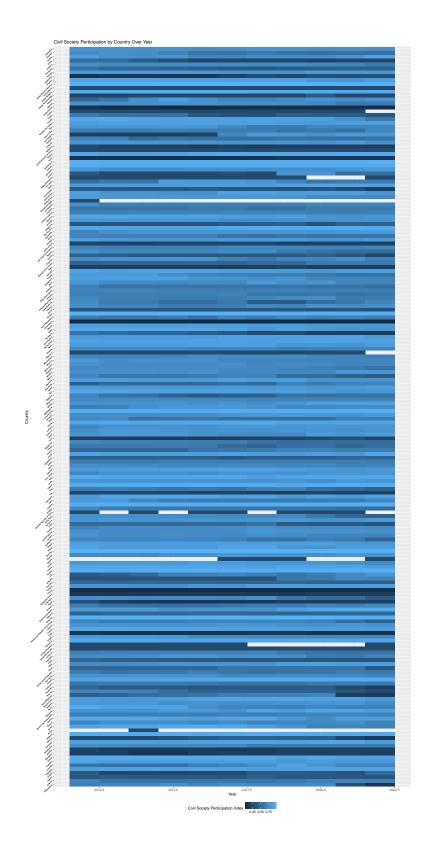

How do our variable choices relate to our hypotheses? - Kaori

Our choices of variables reflect our understanding of civil society and the factors that make it stronger or weaker. Things that bring people together, such as generosity, and things that may bring people apart, such as corruption, we expect to have an effect on participation in civil society, which is why they are included. Civil society repression effort is included because we expect higher repression efforts to have an effect on participation in general, likely negative. This is considered in the civil society index, but will be used in preliminary analysis for better understanding and exploration of the topic. Social support we expect to have a positive relationship with civil society participation because people will be connected with each other, and the same applies to generosity, with the opposite logic applying to presence of war and coups. Civil society index is included because we expect a stronger civil society to have a stronger participation rate, as with education because schools and teaching organizations often are a large part of civil society. The civil society index takes into account the entry/exit of civil society organizations (CSOs), the repression of civil society, and the participatory environment, which

is the types and amount of CSOs available. Government corruption is included because this may dissuade people from participating in civil society or weaken civil society by underfunding it making people less likely to engage in it. Finally, participation in democracy is used because it measures the active level of citizen participation which considers suffrage, direct democracy, engagement with civil society organizations, and subnational elected bodies.
